Rulmea announced Jasper Engineering acquired Engineering Design and the rights to sell and service

Rulmea Corporation announced that Jasper Engineering and Equipment Company of Hibbing, MN has acquired the assets of Engineering Design Services (EDS) and the rights to sell and service Rulmea Motorized Pulleys. EDS began distributing Rulmea Motorized Pulleys in 1993, with a primary emphasis on the US iron mining industry in Minnesota and Michigan, growing into one of the largest distributorships in the International Rulmea Group. Jasper Engineering’s Jerry Rude and Jason Jaritsch in the Hibbing office and Denny Potila in the Ishpeming office will have primary responsibility for Rulmea Motorized Pulleys in Minnesota and Michigan’s Upper Peninsula.

A major international manufacturer of conveyor components, Rulmea Group has manufacturing and sales companies in 15 countries throughout Europe, Asia, Africa, and the Americas. Rulmea Corporation’s president, Mike Gawinski, said “We are very grateful to Roger Mattunen of EDS for providing more than 20 years of excellent Motorized Pulley technical sales and service. We could not have developed the market to its present state without his tireless efforts. We look forward to continuing this tradition with Jasper Engineering, a company which has served the iron range for more than fifty years.”

Initially developed in 1953 in Europe, Rulmea Motorized Pulleys have gained wide acceptance in conveyor systems throughout North America, especially in harsh environments. Since they enclose all drive components within an oil-filled and hermetically-sealed pulley shell, Rulmea Motorized Pulleys increase system reliability, lower maintenance expense, improve personnel safety, save space, and reduce power consumption. Rulmea Motorized Pulleys offer mines, power plants, and shipping terminals an optimal alternative to exposed drive systems with sizes from 8.5” to 40” in diameter and power available up to 330 HP.
